LICENCES A AND B

● LATEST EXPERIENCE — ✕

.NET ARCHITECT & LEAD

I modernised a complex IT monitoring client service to improve its robustness, its ability to scale and its industrialisation.

My role also had a management side: I put together my team of 6 junior developers and grew them into autonomous engineers.

● LATEST EXPERIENCE — ✕

.NET APPLICATION ARCHITECT

I connected the Greek gas network trading interfaces to our real-time movement tracking application.

I also took part in reworking the business processes and documented how they are applied.

● WHAT I BRING — ✕

I bring good humour, rigour and a consistently positive attitude to a team.

Committed and thoughtful, I can gather a complex requirement and work in depth on a new feature just as well as I can react effectively to the unexpected.

● SKILLS — ✕

Programming

● ● ● ● ●

● EDUCATION — ✕

Paris, Epitech, Master's in Information Technology

Dublin, DCU, Master of Computer Applications,
Computer Science French English

● ABOUT ME — ✕

- I have a ball python called Versace.
- I am learning to fly planes and I skydive.
- I am a big fan of metal, country and viking music.
- I love hiking, on foot, with my dog or by motorbike.
- I am curious about everything!

● HOOKTO - XEFI

April 2025 - Present — ✕

.NET ARCHITECT & LEAD

Within the Xefi group, which supports more than 25,000 SMEs in France, I joined Hookto, the subsidiary dedicated to digitalisation and to building an RMM service.

There I put together a team of six junior developers and guided them to real autonomy on varied technical subjects of increasing complexity.

We built a service installed on every machine in the group, covering real-time monitoring, BMR backup and remote command execution.

TASKS :

- Full overhaul of methods, from writing user stories to the use of git
- Business needs analysis and plans matched to our means
- Workshops and devtalks to grow the teams
- A stable, automated CI/CD pipeline
- Recruiting, mentoring and HR follow-up of junior developers

RESULTS : The Hookto teams needed a real framework and a step up in skills. The work I led enabled a transition to far more structured and efficient practices, making the teams autonomous and better equipped for their missions.

● ENERGYONE

January 2025 - April 2025 — ✕

.NET APPLICATION ARCHITECT

EnergyOne sells a SaaS solution to most European markets and to energy producers in Europe (electricity and gas).

Whether electricity or gas, the capacity you can buy and sell is tightly regulated. Cross-border trading in particular follows rules specific to each TSO.

On arrival I drew on my experience of large organisations and banks to help my team focus on its next objectives as a fast-growing company.

TASKS :

- Complex architecture diagrams to help my team understand the differences between technologies and design patterns, in order to extract micro-services from an existing monolithic application.
- Connecting the Greek gas platform, a decisive step for LNG consumption in Europe.
- Redefining the DOR/DOD with the relevant team members
- Full overhaul of the documentation system with Atlassian AI

RESULTS : While my team and my colleagues were very happy with my work, the central HR department in Brisbane, Australia, was concerned about my leaving the Paris region and ended my probation period.

● NATIXIS CIB

Sept 2023 – Dec 2024 — ✕

APPLICATION DEVELOPER AND TOOLING

Joining Natixis, I pursued two objectives: growing the ETFS application used for internal trading, and building tools to monitor the platform, speed up releases and simplify daily life for developers, managers and users.

TASKS :

- Talking to users every day to understand their needs, validate UAT and drive adoption of the platform.
- Designing APIs letting other teams interact easily with ETFS while guaranteeing high quality.
- Rethinking the whole CI/CD chain with XL Release, XL Deploy and Jenkins.
- Monitoring the essential metrics to keep the platform healthy.
- Building internal tools to automate repetitive tasks.

RESULTS : The teams gained in comfort and efficiency: developers could focus on the essentials, managers had reliable indicators, and traders quickly adopted a continuously improving platform, available less than a year after it was designed.

Functional domain: I worked within ETFS to build a fast tool for internal trading, mainly on equities and with the Asian market.

● JAJI

Sept 2022 – August 2023 — ✕

DEVELOPER, TOOLING LEAD

Former colleagues from SGCIB founded an insurance company called "Jaji" in late 2020, and they needed a hand with less experienced team members to build a professional and efficient company. I joined them for a limited time to make sure the quality requirements would be met before the application reached the market in early summer 2023.

TASKS :

- Helping developers and business analysts prioritise their needs by defining an MVP.
- Improving the developers' organisational skills by introducing them to Agile development.
- Creating robust specifications and tests using the three amigos method.
- Building internal tools to improve quality of life by automating redundant tasks.

RESULTS : Moving from a bank to a start-up created some tension at first, but I managed to reduce it once the results started to show. Unfortunately Jaji closed in 2024, bought out by Klésia.

● CACIB

Nov 2020 — August 2022 — ✕

APPLICATION DEVELOPER, COMMANDO

During the Covid-19 pandemic I joined CACIB on their market access and automation platform as a commando, working directly with traders to improve their trading software. It was my first real experience of market trading, and although the order management system we built handles thousands of quotes a day, we had to make each desk responsible for implementing the rules that automate as much of the process as possible. Performance was paramount.

TASKS :

- Building a robust, flexible and high-performance OMS.
- Making sure risk exposure stayed under control.
- Allowing as many users and markets as possible to connect to and use the software.
- Maintaining an essential pillar of CACIB, aiming to be always operational.
- In a difficult context, keeping in touch with team members and end users.

RESULTS : Although adapting to this new situation was hard, I managed to work well with others and was independent enough on most subjects to help wherever I was needed. Most of the core code having been built, we mainly extended our application to accept even more transactions and markets.

● SGCIB

July 2018 — Oct 2020 — ✕

APPLICATION DEVELOPER AND SUPPORT

I joined LIQOR within the LTA/regulation and risk analysis team, on a middle-office application project. Our team bridged front-office and back-office, in an international environment bringing together hundreds of developers and traders. The code had to be carefully documented and tested, and this assignment taught me a large part of the good practices I still use today.

TASKS :

- Contributing to a major reconciliation and regulation tool.
- Developing modular services that strongly improved daily transaction processing.
- Maintaining a critical application and enabling work on earlier dates to correct errors.
- Guaranteeing compliance with regulations such as Basel III and assessing risk exposure.
- Using TDD and clearly defining scope before any change.
- Collaborating with around 200 developers around the world.

RESULTS : Despite demanding processes, Liqor development moved fast. Thanks to good organisation, needs were defined a sprint ahead. This first experience defined the developer I am today.

DETAILED TECHNICAL SKILLS

.NET FRAMEWORK

7 to 14, .net Core 5 to 10

FRONT-END (BASICS)

Blazor, PHP/Laravel, Angular, Nuxt, Vue.js

CLOUD

Azure and AWS

COMMUNICATION

RabbitMQ, gRPC, dapr, SOAP, REST

SERVICE MONITORING

ELK, Grafana, Prometheus

INTEGRATION TESTING

Cucumber (gherkin)

IDE

JetBrains Rider, dotMemory, dotTrace

METHODOLOGIES

Agile, SaFe, TDD, BDD, SOLID principles, Micro-services

BACK-END

C#, .net Core, LINQ, Lambda Expression

DATABASE

Entity Framework, Dapper, SSMS, Postgres, SQL Server

CI/CD

XL Release, XL Deploy, Jenkins, TeamCity, Kubernetes, Docker, Github actions

BACKLOG TRACKING

Azure, Trello, JIRA

UNIT TESTING

Ninject, Xunit, NUnit, NFluent, Moq

VERSION CONTROL

Git, Git Extension

GOOD PRACTICES

Boy-Scout, KISS, DRY, ACID transactions

OTHER

Markdown, MS Office

HOBBIES AND PASSIONS

- My ball python is called Versace because she is black and gold, the colours of the brand
- I love long hikes across the Alps, from refuge to refuge
- When I travel, it is for a road trip by car, van or motorbike
- I am always hunting for the next musical gem
- For years I ran the largest tabletop roleplaying association in France
- I move a lot, I run and lift; I have taken part in trails and obstacle races, solo or in a team
- I love cooking and when I have the time, I brew my own beer!
- I am always up for a bowling game
